**Filter plug-ins:** filter plug-ins allow the filter bars on the ribbon to be customized. The Filter bar has eight sections. Each section shows a button that can be dragged to a different section, allowing customizing the toolbar. Windows (Vista and newer) AutoCAD is able to work in a window that is split to an arbitrary size. The window can be scaled proportionally or one of the two windows can be made full screen. The full screen window can only be made horizontal or vertical. The window size and position can be set, and there is a button to maximize or restore the window. When the window is maximized, the entire drawing area is used, but this is very rare as many users may only work on a small portion of the drawing, often a sub area where only a few things are required. Once the window is maximized, it cannot be moved or reduced in size. A drawing may be split into a variety of viewports (circles, rectangles, 3D views, etc.). Viewports can have their properties (current layer, color, etc.) modified, zoomed, and flipped. There are scroll bars to allow panning to see parts of the drawing that were previously off screen. The dock option on a viewport allows it to be pinned to the left, right, top, or bottom of the screen. Ribbon interface AutoCAD can work with many different user interface styles that can be arranged in a number of ways. The ribbon works best when it is in landscape mode, either horizontal or vertical. It can be dragged to a new location on the screen and it can be resized or hidden when not needed. When not needed, it will collapse to a less-visible state where only the "close" and "settings" buttons remain. On the other hand, the ribbon can be resized to a large size, covering the entire screen, and can be hidden when needed. The ribbon interface works well for drawing as it provides a great deal of space for adding numerous controls, such as Z-order, snapping, or text. Mouse and keyboard The default mouse is a scroll wheel with thumb button navigation. Navigation is a bit stiff on the scroll wheel but this can be fixed by holding down the left mouse button while scrolling. The right mouse button can be used to move the cursor around the drawing in multiple ways. The right click button also has a menu, with a number of options. A tab a1d647c40b
