Automatically record keystrokes, macros and other actions, to conveniently and accurately record your actions. More functionality The programme can record all the user activity on your computer, like keystrokes, mouse movements, system information, mouse clicks, screen shots and more. KeyMacro works on all the Windows systems since Windows 95, so you don't need to download or install anything. The application detects automatically the available keyboards and adds the keyboard to the "Keyboard to record" list, so you only need to

select which one you want to capture. You can also record with any mouse. Although it's not as user-friendly, because you'll have to manually choose the mouse for recording. It's also possible to save a short keystroke, hotkey or macro (select one action, and it will be recorded as a single keyboard, mouse or hotkey keystroke). The saved actions can be edited and modified any time. The output files are pretty self-explanatory; they're named according to the original action, including the full path, timestamp, mouse position, etc. Other information There's also a list of all the actions that have been recorded (by default, there are a few hundred)

along with the timestamp, mouse position and system information, plus the action number. This list can be used to filter the saved actions, in order to find the one you want (like, for instance, recording every time you press the "X" key on the keyboard). The action can also be recorded (e.g., when you press Ctrl+L or Alt+Tab, the KeyMacro will automatically capture it, even if it was not expected). It doesn't require an installer and you don't need to configure anything. One of the coolest things about KeyMacro is that it's compatible with all Windows systems since Windows 95. You can use it with any Windows system (this

one even installs on Windows Server 2016), from the ultra-lightweight Windows 98SE up to the most powerful Windows 10 and Windows Server 2016. I especially like this aspect because the programme actually offers you to run it on Windows 2003 Server and even Windows Server 2008 as well. It will add itself to the list of "Programs that run on Windows 95 and later" (just start it, and it will start recording immediately). Other features KeyMacro can capture in sequence, with delays (in milliseconds), and even record audio. It supports
