It's sometimes ironic that an un-content-aware program can have better functionality than a program designed to do something. Lightroom's semiautomatic mode adequately replaces the Photoshop's Auto mode, especially for some tasks. Lightroom also adds new features and changes some old ones. Editing an image is a tremendously complex task, and this is a complex package. The new features have been grouped according to the places they apply. I will examine each group briefly and let the accompanying links take you to the lengthy descriptions of each feature. Some things are obvious in the video clip, and more obvious by seeing them in the final product. The Crop, Straighten, and Sharpen tools offer you quick results. Crop is implemented as a rectangular marquee, and the Straighten tool (computer monitors and/or printouts often require it,) and Sharpen all have the same interface. Sharpen is a hardly-used tool that is easy to use. The first time you activate it, Lightroom 3 will give you a pop-up, advising you that the rated settings will be used. If you don't like the adjustment (even if you think you do), always select '**Skip this step**', and you'll be safe from doing a permanent damage. Another update to Photoshop contains AI improvements that can be automated (by the developers) or used more actively by the human user. The new "AI Enhance" feature finds objects, performs conversions, and even deals with composition issues. The developers are careful to recommend time-consuming tasks (like retouching) for the human user. Overall, the AI technology is extremely good at what it does, but sometimes it can make mistakes, too.

Although Photoshop is primarily a raster-based image editing program, you can also use it to create line art using the Pen tool. The Pen tool can be used with any layer, but when it's used with a layer that already contains a photo (like a photo layer), the Pen tool works like the Brush tool — or any other eraser tool — and erases any areas inside the layer that are covered by the photo.
